# Chapter 1

## Introduction

The `finmetrika-ml` library is a machine learning library for practical projects, predominantly for the financial industry.

The library is organized as follows:

```
finmetrika_ml
├── data
│   ├── processing.py
│   └── vizualization.py
├── model
│   ├── training.py
│   ├── evaluation.py
│   └── metrics.py
└── utils.py
```

To install use the `pip` command in your virtual environment:

```
pip install finmetrika_ml
```

## **Chapter 2**

# **Data Processing**

# Chapter 3

## utils

Various utility functions for checking and defining compute engine, logging and creating the experimentation documentation.

Reproducibility is one of the most important aspects of proper project development and management, for ourselves, as well as for other people to whom we will share the project and possibly need to make decisions based on the results.

### set\_all\_seeds

```
set_all_seeds(seed:int)
```

*Set the seed for packages: python, numpy, torch, torch.cuda, and mps*

Arguments

	type	default	description
<b>seed</b>	int	None	Positive integer value.

We can set the seed for most of the libraries that we use in machine learning like: numpy, torch, torch.cuda, mps as well as for Python in general.

```
set_all_seeds(seed=42)
```

If you are using FLAGS then simply replace the value of the seed for the dataclasses defined for the reproducibility. For example, if my dataclass is called seed then I would use:

```
set_all_seeds(FLAGS.seed)
```

### check\_device

```
check_device(verbose:bool)
```

*Check which compute device is available on the machine.*

Arguments

	type	default	description
<b>verbose</b>	bool	True	Print which device is recognized.

```
device = check_device()
```

Using mps device!
